## OVERVIEW

# About These Process Flows

This document presents professional swim-lane process maps for both the current (As-Is) and future (To-Be) visitor management processes. Each diagram is rendered below and is also available in editable Mermaid and draw.io formats in the accompanying source file.

The **As-Is** flow exposes where the current manual process breaks down — informal approvals, manual registration, inconsistent identity checks, and no record of who is on site. The **To-Be** flow shows the redesigned digital journey, where the visitor self-registers before arrival, approvals route automatically, a QR pass is issued, check-in is self-service, security has real-time visibility, and feedback is captured on exit.

## Legend

|                       |                                                            |
|-----------------------|------------------------------------------------------------|
| Visitor               | Steps performed by the visitor                             |
| Host                  | Steps performed by the employee host                       |
| Receptionist / System | Reception actions (As-Is) or automated VMS actions (To-Be) |
| Security              | Identity, screening, and monitoring steps                  |
| Decision              | A branch / decision point in the flow                      |
| Pain point / Outcome  | Red = As-Is failure point; Green = To-Be positive outcome  |

## CURRENT STATE

# 1. As-Is Process Flow

Figure 1 — Current visitor management process (manual, fragmented across four roles)

## CURRENT STATE

## As-Is Pain Points (mapped to steps)

| Process Step           | Pain Point                        | Severity |
|------------------------|-----------------------------------|----------|
| Host coordination      | No standard request channel       | High     |
| Manager approval       | Informal, untracked, 4+ hr delay  | High     |
| Reception registration | Manual re-keying, 12–18 min queue | High     |
| Identity check         | Inconsistent, 60–70% compliance   | Critical |
| Visitor on site        | No real-time visibility           | Critical |
| Visitor leaves         | No check-out / no record          | Medium   |

**Bottom line:** the average end-to-end experience involves approvals exceeding four hours, reception processing of 12–18 minutes, and no reliable record of who is in the building — carrying productivity, security, and compliance cost.

## FUTURE STATE

## 2. To-Be Process Flow

Figure 2 — Future digital visitor management process (automated, with real-time visibility)

## FUTURE STATE

## To-Be Improvements (mapped to steps)

| To-Be Step                  | Replaces (As-Is)            | Benefit                     |
|-----------------------------|-----------------------------|-----------------------------|
| Self-registration via link  | Manual reception re-keying  | < 2 min check-in            |
| Auto host validation        | No host verification        | 100% valid host             |
| Automated approval workflow | Informal email approval     | < 30 min approvals          |
| Watch-list screening        | Inconsistent identity check | > 95% compliance            |
| QR-code pass                | Handwritten / no pass       | Fast, contactless entry     |
| Real-time on-site list      | No visibility               | Live security + evacuation  |
| Auto check-out + feedback   | No record                   | Auditable + experience data |

**Bottom line:** every step that was manual, untracked, or invisible in the As-Is process is now digital, automated, and measured — targeting ~85% faster processing, >80% faster approvals, and >95% security compliance.
